

Uncapped bi-Kappa sampler, $\theta_{\perp} = 1$, $\theta_{\parallel} = 2$, $N = 100\,000$ samples per seed, $\mathbf{B} \parallel \hat{\mathbf{z}}$

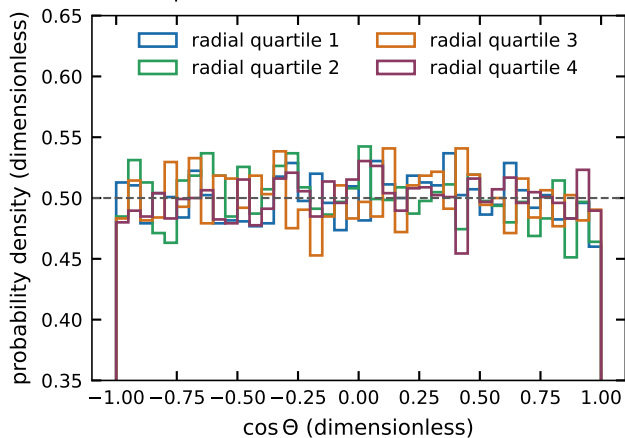

(a) radial law residual: $W = 1/(1 + R^2)$

(b) direction: $\cos \Theta$

(c) independence of R and direction, $\kappa = 2$

(d) radial KS statistic vs κ
